

## TMC Rock Curing System 650L

The TMC Rock Curing System has been designed to offer excellent water movement through the rock, and the V<sup>2</sup>Skim Protein Skimmer will ensure optimum water quality. This system is significantly larger than the TMC 250L Rock Curing System and is great for high volume live rock turnover.

### The TMC Rock Curing System incorporates:-

- 2 x 3000L pumps Circulation Pump.
- V<sup>2</sup>Skim 2000 Protein Skimmer, including water supply/venturi pump.
- 650 litre Pallet Bin Reservoir, with 1" drainage port.
- Fully submerged ring main, allowing for excellent upwelling water movement through the live rock.

Uncured live rock should never be added to an established aquarium. Whenever possible it should be placed in a separate system to allow it to fully cure first.

The excessive ammonia spike that can be created is best assimilated in a rock curing system, allowing volumes of live rock to be "made ready" prior to selling into your customers' tanks or your own shop display.
